

Ozone used for Italian Senators with Covid

THE HONORABLE PEDRAZZINI ADVISES SENATORS MOLLAME AND CROATTI TO USE OXYGEN OZONE THERAPY

The news has come that two senators of the Republic, Francesco Mollame and Marco Croatti, tested positive for Covid.

While discussing whether it is necessary to suspend the sessions taking place in the Senate, "Orbisphera" interviewed the Honorable Claudio Pedrazzini, the first deputy who tested positive at Covid in March of this year.

"You were the first positive Covid MP. What do you feel like saying to your fellow senators?"

"To colleagues I feel I can wish a speedy recovery. Having been the first MP to be infected with the virus, I recommend approaching the quarantine period very carefully".

"For our work we deputies and senators come into contact with many people. We travel often. It is therefore very easy to contract the virus.

As for the treatment, I recommend following the doctors' instructions, because Covid can create problems even in asymptomatic cases. In this context, I recommend to Senators Mollame and Croatti to practice oxygen ozone therapy together with pharmacological treatment. The experimentation in Italy and in other countries has confirmed the effectiveness of ozone therapy in the various phases: pre, during and post Covid. This is a safe and risk-free practice."

"Can you remind us of what happened when you got sick, and can you tell us how you were treated?"

"I was born, live and run my business in an area that was among the first red areas of the country. On March 6 and 7 I had a fever that came and went. On March 9, I had a fever of 37.5 degrees I took the test and tested positive. I informed the Chamber of Deputies and I locked myself in the house in quarantine.

In the following days the virus began to take hold with a high fever and shortness of breath. Together with the drug treatment I practiced oxygen ozone therapy, which I already knew about thanks to professor. Marianno Franzini international president of the Oxygen Ozone Therapy Society (SIOOT), equipped with all safety measures, came to my home with great courage and gave me ozone therapy.

There is no doubt about the effectiveness of this treatment. Within a week the fever subsided, the values returned to normal, and all I still suffered from was lack of air.

With four sessions of oxygen ozone therapy, I was cured. I took two swabs and they both came back negative. I can say that oxygen ozone therapy has defeated the virus, reduced quarantine times and also helped me in post Covid to overcome exhaustion and other problems resulting from the disease."

"What are the reasons why you recommend oxygen ozone therapy to the two senators who tested positive for Covid?"

"I have experienced the benefits of ozone on myself. I can testify of its effectiveness. I have long known the scientific literature and experiments in which the antiviral, antibacterial and anti-fungal characteristics of ozone are clearly confirmed. This is why I advised the health authorities and the Scientific Committee to also think about the use of oxygen ozone therapy to treat the sick and combat the spread of Covid."

"In recent months, several studies have been published which report how effective oxygen ozone is in curing Covid patients. This is why I would recommend that you learn more about it and make it available to all patients infected with the virus.

You are a member of the 12th Social Affairs Commission which also deals with public health. On June 3, the Commission heard professors Marianno Franzini and Luigi Valdenassi, respectively international president and national president of SIOOT, and Arnaldo Andreoli, national vice president of SIOOT and director of the Specialized Rehabilitation Unit at the Sacco Hospital in Milan. The subject of the hearing was the ongoing trial for the treatment of patients affected by Covid-19. The deputies who spoke showed considerable interest in ozone therapy. Are there any developments regarding the possible use of this practice?"

"Parliament, and in particular the Commission of which I am a member, continued the dialogue with the health authorities, trying to deepen their knowledge and practice oxygen ozone therapy as a possible cure for Covid patients, which can also be used in the pre and post phase. infection I want to point out that oxygen ozone therapy is not an alternative to drug therapy, on the contrary, it can be said that ozone strengthens and makes drugs more effective.

From this point of view, I can say that a course of study has begun to verify the effectiveness of ozone therapy associated with drug therapy. The study is carried out in collaboration between the Scientific Society of Oxygen Ozone Therapy (SIOOT), the Italian Society of Infectious and Tropical Diseases (SIMIT) and the biopharmaceutical company Gilead Sciences. We expect positive surprises"
